The Ecosystem for Campus Talent

Super Admin Functional Requirements

Nine modules covering user management, finance, gigs, scoring, safety, content, configuration, analytics, and audit

Version 1.0 | June 2026 | Confidential

Purpose & Access Principles

This document defines the full functional scope of the Super Admin role on Zumbarl — the highest level of platform access, held by the founder and most trusted technical lead only. It is organised into nine modules. Each module specifies what the role can see, what it can do, and where deliberate limits exist.

Three principles govern every requirement in this document:

- **Least privilege by default:** Even the Super Admin role does not have unrestricted access to everything. The Safety module is intentionally restricted — Super Admin sees aggregate metrics, never individual report content.
- **Everything is logged, nothing is silent:** Every action taken through Super Admin tools is recorded in an append-only audit log with actor, timestamp, before/after state, and reason.
- **Reversibility where possible, transparency where not:** Most actions (suspensions, role changes, score adjustments) are reversible and logged. The few that aren't reversible (financial release, certificate issuance) require additional confirmation steps.

Super Admin access should be held by no more than two people at any company stage — the founder and one trusted technical co-founder or CTO. Every other team member operates through a narrower role defined elsewhere in the access control system.

Module 1 User & Account Management

Full visibility and control over every account on the platform — students, companies, and internal team members.

Function	Requirement
Search and view any account	Full profile, KYC status, role, gig history, score history, and transaction history. Searchable by name, email, phone, student ID, or business registration number.
Suspend or reactivate accounts	Immediate suspension with a logged reason. Reactivation requires a separately logged justification. Suspended accounts cannot transact but retain all data.
Manually review KYC	Override automated KYC checks for edge cases. View submitted documents directly. Set a custom verification tier where standard tiers don't fit.
Assign and change roles	Promote to campus ambassador, demote, or grant internal roles (operations, safety officer, finance officer, content moderator). Every change logged with before and after state.
Force session revocation	Invalidate all active sessions for an account immediately. Used for compromised accounts or active security incidents.
Merge duplicate accounts	Combine gig history, scores, and wallet balances from duplicate student accounts into one canonical record.
Bulk actions	Bulk KYC approval for verified campus cohorts, bulk notification sends, bulk role assignment for ambassador onboarding.

Account deletion requires two-person approval — Super Admin plus an Operations Manager — and a 14-day soft-delete window before permanent removal. This protects against accidental or malicious deletion of a student's entire platform history.

Module 2 Financial Oversight

Complete visibility into every transaction on the platform, with the ability to intervene when something goes wrong. This is the module requiring the strictest access control and the most complete audit trail, because it touches real money moving to and from real students.

Function	Requirement
View all transactions	Every escrow hold, payout, platform fee, chama contribution, and micro-advance — searchable and filterable by date, user, status, and amount.
Manual escrow release or refund	Override automated escrow logic for disputed or stuck transactions. Requires a logged reason and a reference to the related dispute case — never released without a paper trail.
M-Pesa reconciliation dashboard	Compares platform transaction records against Safaricom Daraja API confirmations. Automatically flags mismatches for review rather than relying on manual checking.
Platform fee configuration	Set and adjust transaction fee percentages, placement fee structure, and pipeline access pricing. All changes are versioned with effective dates and are never applied retroactively.
Chama oversight	View all chama wallets, contribution rates, and whitelisted payee lists. Authority to freeze a chama wallet if fraud is suspected.
Micro-advance risk dashboard	View all active advances, default rates, and platform exposure. Authority to adjust eligibility thresholds platform-wide in response to risk patterns.
Financial reporting export	Generate revenue reports, transaction volume reports, and reconciliation statements for accounting purposes and investor updates.

Every financial action requires two-factor re-authentication at the moment of the action — not just at login. No financial record is ever hard-deleted; everything is soft-deleted with complete history retained for audit purposes, indefinitely.

Module 3 Gig & Marketplace Oversight

Monitoring and intervention tools for the core gig marketplace, covering disputes, quality issues, and policy violations.

Function	Requirement
Dispute resolution console	View the full brief, submission, communication log, and any evidence for a disputed gig. Issue a binding resolution — release, refund, or split payment.
Remove or suspend gig listings	Take down briefs that violate platform policy — discriminatory requirements, unsafe working conditions, or scope abuse. Posting company is notified with the reason.
Flag monitoring queue	Auto-flagged gigs — plagiarism hits, suspicious metric spikes, location mismatches — land in a review queue sorted by severity for manual resolution.
Override deliverable verification	Manually mark a submission as verified or rejected when automated checks (plagiarism, AI detection, GPS matching) return an inconclusive result.
Gig category and template management	Add, edit, or retire gig types and deliverable templates. Configure which verification rules apply to each category.

Module 4 Score, Pipeline & Career System Control

Tools to monitor, debug, and — in rare, carefully logged cases — manually correct the systems that determine a student's score and career progress.

Function	Requirement
Score formula configuration	Adjust dimension weights, tier thresholds, and penalty rules platform-wide. Changes are versioned and apply only going forward — students are never retroactively rescored.
Manual score adjustment	Correct an individual score in rare cases — e.g. a rating proven to be fraudulent or retaliatory. Always logged with a reason and fully reversible.
Pipeline stage threshold configuration	Set the unlock criteria for each of the five career stages, either globally or per career path (Marketing & Design, STEM, Commerce, etc).
Transition mode override	Manually unlock or delay transition mode for an individual student in exceptional circumstances — e.g. a student who took a deferred year.
Endorsement audit	Review endorsements for abuse patterns — e.g. a company endorsing a student without corresponding gig history. Authority to revoke fraudulent endorsements.
Certificate management	View issued certificates and, in rare cases, revoke one if fraud is discovered after issuance. Revocation is permanently logged and visible if the certificate is later verified by a third party.

Module 5 Safety System Oversight

This module is deliberately the most restricted in the entire Super Admin scope. Super Admin has visibility into safety system health, but not into individual report content — that access is reserved exclusively for the dedicated Safety Officer role.

Function	Requirement
Safety system metrics only	Volume of reports, average resolution time, and partner organisation response rates — aggregate data only, never individual report content.
Assign and manage Safety Officers	Grant or revoke the Safety Officer role. Super Admin cannot personally view report content unless separately and explicitly holding that role.
Company suspension on safety grounds	Authority to suspend a company account based on a formal recommendation from a Safety Officer — without independently viewing the underlying report that triggered it.
Partner organisation management	Manage the list of external response partners — FIDA Kenya, the Gender Violence Recovery Centre, Befrienders Kenya — including contact details, routing rules, and availability status.

This is the most important boundary in the entire admin system. Super Admin access to the platform must not include safety report content. This has to be enforced at the database and API level, not by policy alone — a Super Admin attempting to query safety tables directly should be technically blocked, not merely discouraged. If this boundary is not real, the safety silo designed elsewhere in the platform means nothing.

Module 6 Content Moderation

Oversight of marketplace listings, group posts, portfolio content, and other user-generated material across the campus life features of the platform.

Function	Requirement
Flagged content queue	Marketplace listings, group posts, portfolio items, and messages reported by other users land here for review, prioritised by report volume and severity.
Remove or restore content	Take down policy-violating content with a logged reason. Restore content that was removed in error.
Group and club oversight	View and, where necessary, dissolve student-created groups or clubs that violate platform guidelines.
Notes and past papers review	Spot-check uploaded academic content for copyright or academic integrity concerns.

Module 7 System Configuration

Platform-wide settings that affect how every feature behaves — the control panel for the platform's operating parameters.

Function	Requirement
Campus management	Add, edit, or deactivate campuses. Assign campus managers. Configure campus-specific settings such as marketplace scoping and local service availability.
Feature flags	Toggle features on or off platform-wide or per campus, enabling staged rollouts — for example, enabling transition mode on one campus before others.
Notification template management	Edit the content of automated notifications across WhatsApp, SMS, email, and push without requiring a code deployment.
Integration health monitoring	Status dashboard for M-Pesa, WhatsApp Business API, SendGrid, and Africa's Talking — uptime, error rates, and the timestamp of the last successful call.
Working hours and safety rule configuration	Adjust the 25-hour weekly work cap, physical gig curfew times, and other platform-wide protective rules.

Module 8 Analytics & Reporting

Platform health and growth visibility — the data that informs business decisions, operational priorities, and investor reporting.

Function	Requirement
Platform health dashboard	Active students, active companies, gigs posted and completed, gross merchandise value, revenue by stream, and retention by cohort.
Campus-level breakdown	All key metrics filterable by campus, surfacing which campuses are performing well and which need ambassador attention.
Pipeline and placement funnel	Conversion rate tracking from gig completion, to pipeline flag, to rehearsal sprint, to placement offer, to accepted placement.
Custom report builder	Build and save custom queries across platform data for investor updates or internal operational reviews.

Module 9 Audit Log & Security

The complete record of everything that happens on the administrative side of the platform — who did what, when, and why. This module is what makes every other module trustworthy.

Function	Requirement
Complete audit trail	Every admin action — account suspension, escrow override, score adjustment, role change — is logged with the acting user, timestamp, before and after state, and stated reason.
Admin activity monitoring	View the full action history of any internal team member. Useful for onboarding review and for catching mistakes early.
Two-factor authentication enforcement	Mandatory 2FA for all admin-tier roles. Super Admin sessions expire faster than standard user sessions — for example, four hours rather than thirty days.
Permission change history	Full history of who granted or revoked which role to whom. This is the primary mechanism for catching privilege escalation issues.
IP and device tracking	Log IP address and device fingerprint for every admin session. Automatic alert on access from a new or unusual location.

The audit log itself must be append-only and tamper-evident. Not even a Super Admin should be able to edit or delete an audit log entry. This is the one technical guarantee that makes every other access control claim in this document meaningful — without it, there is no way to verify that the safety silo, the financial controls, or the score integrity rules are actually being respected in practice.

Summary Matrix

Quick reference of access scope across all nine modules.

Module	Full access	Notable restriction
Users & accounts	Yes	Deletion needs 2-person approval
Financial oversight	Yes	2FA re-auth on every action
Gig & marketplace	Yes	—
Score & pipeline	Yes	Never retroactive rescoring
Safety	Metrics only	No report content access
Content moderation	Yes	—
System configuration	Yes	—
Analytics & reporting	Yes	—
Audit log & security	View only	Cannot edit or delete entries
